

How to Fix your WIFI loss after Windows 10 Update

Microsoft has rolled out updates that have been killing the WIFI on many computers. This walkthrough will show you the very easy way to gain access back on your Core+ Laptop.

If you have lost Wifi on your Core+ you will need access to another computer with Internet Access and a USB flash drive.

First step is to go www.beantech.net

From here click on the Support Link at the top right next to the Cart Icon

SUPPORT

This will bring up the Support Page where you will find the link to the patch for the [Wifi Driver](#)

This will then download the EXE file that you will need to put onto your Flash Drive. If the web browser does not ask where you would like to save it – it will by default save to the Downloads folder of the computer you are using. If it does this you just have to move the file from the Downloads folder to the Flash Drive.

Now that you have the file you are all set up to install the driver onto your Core+. Hook the USB Flash Drive to your Core+ Laptop using the USB conversion cable that came with the PC. Copy the file “beantechwifix.exe” that was downloaded on to your lap top.

All you have to do from here is double click on the EXE file and follow the on screen steps. Once it is finished installing it will ask you to reboot your computer. Once rebooted your laptops WIFI will be restored.
